WorkRadar

Demo Video Script

Target length · 6 min 30 s
Brief allows · 5 to 7 minutes
Format · MP4 or Loom link

BEFORE YOU RECORD

- Open the MVP and click **Reset demo data**.
- Open the UX boards in a second tab and the two PDFs in a third.
- Record at 1080p with your camera on in a corner.
- Do one silent run-through of the clicks first.

CLICK PATH FOR THE LIVE DEMO

1. Dashboard: read the brief aloud, hover a radar dot
2. Needs you now: open the UPI refund item
3. Item page: digest, next step, score breakdown
4. Back, then Priority feed: filter "Blocked"
5. Assign the OTP item to Vikram
6. Snooze the appraisal item, then Undo
7. Mark the staging access item done; show the brief update
8. Search "refund", then a nonsense word
9. Simulate Jira outage; filter Jira; Try again

FACTS YOU CAN QUOTE

- 17 mock items, 4 tools, 6 teammates
- 621 lines of source, no third-party JavaScript
- Score is a sum of visible factors, capped at 99; Critical is 70 and above
- The refund blocker scores 86 before its 6 PM deadline: 34 + 18 + 14 + 12 + 8
- Metrics in the PRD are pilot targets, not results

SAY IT IN YOUR OWN WORDS

The lines on the right are prompts, not a teleprompter. Evaluators mark **your reasoning**: why this problem, why these trade-offs. If you changed anything after reviewing the build, say what and why at 5:00.

Six and a half minutes, five things to prove

The brief asks the video to show problem understanding, product decisions, the live application, the AI workflow and future improvements. Each block below maps to one of them.

RUN SHEET

TIME	PROVES	ON SCREEN	TALKING POINTS
0:00 0:40	**Problem understanding**	You on camera, then PRD page 1	A manager rebuilds status every morning from Slack, Jira, GitHub and email. No tool ranks across them or shows who is stuck. WorkRadar answers four questions: top work, what happened, what needs attention, who is blocked.
0:40 1:30	**Users and scope**	PRD personas, journey table, scope sidebar	Primary user is a first-line manager like Priya with six engineers. The journey goes from four tools to one brief. MVP is front end only on mock data: no sign-in, backend or connectors yet, as the brief allows.
1:30 2:10	**Product decisions**	UX boards, then PRD section 07	Three decisions: summary before detail; every rank shows its reasons, because managers ignore a priority they cannot explain; every action can be undone. Split "Needs you now" from "Top work today" so my actions are separate from the team's load.
2:10 4:30	**Live application**	The MVP, following the click path on the left	Read the brief. Open the refund blocker: digest, suggested step, score of 86 and its five factors. Filter the feed to Blocked. Assign, Snooze with Undo, Mark done, and point out the brief and "What happened today" updating. Search across tools. Show the no-results state and the Jira outage state with its cached-copy label.
4:30 5:30	**AI workflow**	AI Workflow PDF, sections 01, 04 and 05	One build prompt: the brief plus session notes, given to Claude. Claude produced the PRD, boards, code and tests. Six things changed after the first build, for example the incident weight went from 40 to 58 because a live incident ranked below two blockers. Trade-offs: plain JavaScript over React, visible rules over a learned model, and an AI brief with a rule-based fallback.
5:30 6:10	**Future improvements**	PRD phased plan	Phase 1: read-only Jira and GitHub connectors with sign-in. Phase 2: Slack and email, live digests, "ranked wrong" feedback. Phase 3: write-back and a 9 AM brief in Slack. Before any of it: security, scale and data-handling review.
6:10 6:30	**Close**	Dashboard	The measure of success is triage time: from opening the page to the first action in five minutes or less. Thank the reviewers and name the five files submitted.

Q AND A Questions a reviewer may ask

QUESTION	SHORT ANSWER
Is the summary really AI-generated?	Inside Claude, "Write with Claude" sends the ranked items to the model with the prompt in the workflow document. Elsewhere, and offline, the app uses a rule-based summary and labels it as such.
Why should I trust the ranking?	Every item lists the factors and points behind its score. Weights are judgement today; the pilot adds "ranked wrong" feedback to tune them.
Is this production-ready?	No. It is a prototype on mock data. Sign-in, connectors, security, scale and licensing review come before real use.
Why not React or Lovable?	For a single-screen MVP, plain JavaScript needs no build step and opens straight from the ZIP. A team build would move to a component framework in phase 1.
